

Steel Replica Windows for Historic & Contemporary Architecture

The Winco 3250 Steel Replica Window Series is widely recognized for historic preservation and steel window replacement projects, but its narrow-profile aluminum design also makes it an excellent choice for contemporary commercial architecture. When specified without simulated divided lites (grids), the 3250 Series creates clean sightlines and expansive glass areas that complement modern office buildings, schools, mixed-use developments, and institutional projects.

Architects can achieve the timeless appearance of steel windows while benefiting from the thermal performance, durability, and cost advantages of an architectural-grade aluminum window system. Whether the design intent is historic restoration, adaptive reuse, or new construction, the 3250 Series provides the flexibility to support both traditional and contemporary architectural styles with a single window platform.
